## BSR-8020/WP Waterproof Addressable input-output unit

| TECHNICAL CHARACTERISTICS |  |
| :--- | :---: |
| OPERATION VOLTAGE | $21-28 \mathrm{~V}$ |
| QUIESCENT CONSUMPTION | 0.7 mA |
| ALARM CONSUMPTION | 1.3 mA (with activated LED) |
| QUIESCENT CONSUMPTION WHEN USED AS A CONVENTIONAL DEVICE DRIVER | 5.6 mA |
| ALARM CONSUMPTION WHEN USED AS A CONVENTIONAL DEVICE DRIVER | 30 mA |
| EXTERNAL POWER SUPPLY | $21-28 \mathrm{~V}$ |
| INSTALLATION | For internal use only |
| DEGREES OF COVER PROTECTION | IP65 |
| PRODUCED IN ACCORDANCE WITH | EN 54-18 |
| OPERATION TEMPERATURE RANGE | -10 to $60{ }^{\circ} \mathrm{C}$ |
| RELATIVE HUMIDITY | Up to 95\% |
| CONSTRUCTIONAL MATERIAL | ABS/PC |
| DIMENSIONS | $155 \times 80 \times 43 \mathrm{~mm}$ |
| WEIGHT | 170 gr. |
| GUARANTEE | 2 years |

## Thank you for your trust in our products Olympia Electronics - European manufacturer

## GENERAL

The input-output unit is recognized and programmed by the BSR-2100 panel. This device is used in order that non-addressable devices that have a free relay contact (such as fire alarm panels, flow switches and conventional detectors) to be connected on the loop. The input unit is fully monitored and has the capability to send to the panel, with a suitable connection, three states: quiescent, fault, alarm.
The output unit contains a fully programmable by the panel relay with a rating of (30V/1A).
The red LED which blinks periodically in the quiescent state is a power and good operation indication. The LED lights and remains lit when the specific input unit issues an alarm to the panel. The LED remains also lit when the sirens are deactivated from the panel in order to indicate the precise point where the alarm originated from. The Led is turned OFF after a panel reset. Each device must have an address, that is recognized by the panel. It is not allowed for two devices on the same loop to have the same address. Page 4 contains the full table that shows the addresses and the setting with the dip-switches. Up to 127 units can connected to each panel.

INSTALLATION (Notice!!! The mounting accessories are included).

1. Unfasten the front cover screws and remove the cover.
2. Locate the mounting holes and use the supplied accessories to mount the unit on the required position.
3. Pass the cables through the cable glands and make the required connections.
4. Notice!! If an additional entry hole is required then remove the break-out plastic and install the supplied cable gland.
5. Set the address on the dip-switch (page 4 and 5).
6. Reinstall the front cover and fasten the screws that were removed in step 1.

## OPERATION

The device has 4 different operation modes:

## 1) Input/Output Unit

In this function input and output units are independent.
The input unit is used in order to connect non addressable devices, that have a free relay contact (such as conventional alarm panels, or flow switches), to the loop of the panel. The input unit is fully monitored and has the capability to send to the panel, with a suitable connection, three states: quiescent, fault, alarm. The output unit contains a relay that is fully programmable from the panel with a rating of $(30 \mathrm{~V} / 1 \mathrm{~A})$. The red LED which blinks periodically in the quiescent state is a power and good operation indication. On the panel, the input unit is shown as "INPUT/OUTPUT UNIT XXX" (where XXX is the set address of the device). In this function, the terminal resistor is $56 \mathrm{k} \Omega$ and the alarm resistor is $10 \mathrm{k} \Omega$.

## 2) Input unit

The input unit with auxiliary relay is used so as to provide an additional input to the loop. Gas sensor types BS-685 and BS-686 can also be connected. It contains an input that is fully monitored for open and short circuit conditions and a relay ( $1 \mathrm{~A} / 30 \mathrm{~V}$ ), which is activated for 5 seconds after a panel reset (when the dip-switch number 8 is in the OFF position). On the panel, the input units are shown as "INPUT UNIT XXX" (where XXX is the set address of the device). In this function, the terminal resistor is $56 \mathrm{k} \Omega$ and the alarm resistor is $10 \mathrm{k} \Omega$.

## 3) Conventional detector driving unit

The driving unit for conventional detectors is used in order to connect conventional detectors to the addressable panel. The device can be connected to the BSR-2104 and BSR-2114 panels. It can power up to 10 detectors and has protection against the detection of an open circuit or the disconnection of a detector. A $56 \mathrm{k} \Omega$ resistor is installed by default on the terminals $+\mathrm{IN},-\mathrm{IN}$. We replace the $56 \mathrm{k} \Omega$ resistor with a $10 \mathrm{k} \Omega$ resistor. We install the $10 \mathrm{k} \Omega$ resistor to the last detector of the line. On the panel, the input unit is shown as "ADAPTOR UNIT XXX" (where XXX is the set address of the device). The LED lights and remains lit when the specific input unit issues an alarm to the panel. The LED also remains lit if the sirens are deactivated from the panel. The LED of the detector that issued the alarm also remains lit in order to show the precise alarm origin. LED is turned OFF after a panel reset. In this operation we have increased consumption and cannot connect more than 7 BSR-8020/WP on each loop. In this function the terminal resistor is $10 \mathrm{k} \Omega$ and the alarm resistor is $1 \mathrm{k} \Omega$.

## 4) Conventional detector driving unit with external power supply.

This function is the same as the previous one. The only difference between the two, is that an external power supply is used. The external power source must have an output rating of 2128 V and must not be interrupted during a power failure. In this function the terminal resistor is $4.7 \mathrm{k} \Omega$ and the alarm resistor is $1 \mathrm{k} \Omega$.

The above functions are set using the dip-switches 9 and 10. The dip-switch 8 determines a sub function depending on the case.

## Operation as an Input/Output unit

## Connection with a conventional panel

BS-1636 terminals

Connecting a BSR-8020/WP to a BS-1636 panel. ALARM and FAULT RELAYS are used. According to this connection, when the panel detects a fault, the BSR-8020/WP will send a fault signal to the central panel and when the BS-1636 detects alarm on a zone, the BSR-8020/WP will send an alarm signal.

## Operation as an Input/Output unit

Connecting with a flow switch

| Operation | Dip-switch setting |
| :---: | :--- |
| Operate with independent <br> programmable <br> input and output | ON |
| Operate with a controller <br> output by the input <br> (Extinguishing function) | ON |

Connecting a BSR-8020/WP with an isolation lock. When the lock is activated (short circuit), the output of the device does not operate and the message " DISABLEMENT " is shown on the panel. The dip-switch 8 of the BSR-8020/WP must be in the ON position. It can be used in a fire extinguishing system.

## Operate as a Input unit

| Operation | Dip-switch setting |
| :---: | :---: |
| Relay is activated for <br> 5 seconds after a reset | ON |
| The relay is activated <br> only when the input <br> is activated | ON |

24 V power supply from panel

## Convetional detector driving unit

| Operation | Dip-switch setting |
| :---: | :---: |
| During an alarm, it <br> interrupts <br> the power to the zone to <br> reduce the consumption | on |
| During an alarm, the <br> power of the zone remains <br> in order to indicate which <br> detector issued the alarm. | ON |

Connecting a BSR-8020/WP with conventional detectors. A $10 \mathrm{k} \Omega$ terminal resistor must be connected on the last detector. The maximum number of detectors per unit is 10. An external LED BS-572 can be connected on one of the detectors. With the dip-switch 8 we can set if during an alarm the zones power will be interrupted or not. (according to the table above). If the dip-switch 8 is in the ON position, the maximum number of devices is 7, whereas if the dip-switch 8 is in the OFF position, the maximum number of devices is 30. The total consumption must also include the consumption of the other devices.

## Conventional detector driving unit with external power supply

Connecting a BSR-8020/WP to conventional detectors. A $4.7 \mathrm{k} \Omega$ resistor must be installed on the last detector. The maximum number of detectors per device is 40 conventional detectors of olympia electronics. According to EN 54 the maximum number of detectors per zone is 32 devices. The maximum consumption of the detectors in idle state, must not exceed the 2.5 mA .
The power is supplied by an external power supply and thus does burden the loop. The power consumption is that of an input/output unit. The external power supply must have an output range $21-28 \mathrm{~V}$ and must not be interrupted during a power failure.
Additionally, the external power supply must be isolated from the main power grid and its power must be calculated depending on the maximum load. If for example we have 10 such devices and each device consumes 30 mA during an alarm then the power supply must be capable of providing at least 300 mA .

## Certification

Waterproof Addressable inputoutput unit BSR-8020/WP certified from H.E.E.Q.A.C. Also H.E.E.Q.A.C. controls the production according to the CPR number:

## WARRANTY

Olympia Electronics guarantees the quality, condition and operation of the goods. The period of warranty is specified in the official catalogue of Olympia Electronics and also in the technical leaflet, which accompanies each product. This warranty ceases to exist if the buyer does not follow the technical instructions included in official documents given by Olympia Electronics or if the buyer modifies the goods provided or has any repairs or re-setting done by a third party, unless Olympia Electronics has fully agreed to them in writing. Products that have been damaged can be returned to the premises of our company for repair or replacement, as long as the warranty period is valid.
Olympia Electronics reserves the right to repair or to replace the returned goods and to or not charge the buyer depending on the reason of defection. Olympia Electronics reserves the right to charge or not the buyer the transportation cost.
